

**TYSABRI Treatment Initiation Form**  
**TYSABRI (Natalizumab) 300 mg concentrate solution for infusion**

**This form should be read carefully before starting treatment with TYSABRI. Please follow the advice in this form to ensure that you are fully informed of, and understand the risk of PML (progressive multifocal leukoencephalopathy), IRIS (Immune reconstitution Inflammatory Disease) and other important adverse effects of TYSABRI**

**Before starting treatment with TYSABRI you should:**

- **read the Package Leaflet which is included in each box of TYSABRI;**
- **read the Alert Card given to you by your doctor;**
- **discuss with your doctor the benefits and the risks associated with this treatment.**

The Package Leaflet and the Alert Card contain important safety information about PML, a rare brain infection that has occurred in patients who have been given TYSABRI and which may lead to severe disability or death.

PML is associated with an uncontrolled increase of the JC virus in the brain, although the reason for this increase in some patients treated with TYSABRI is unknown. JC virus is a common virus which infects many people but does not normally cause noticeable illness.

The risk of PML with TYSABRI is higher

- If you have antibodies to the JC virus in your blood.
- The longer that you are on treatment with TYSABRI, especially if you have been on treatment for more than two years
- If you have taken an immunosuppressant (a medicine that reduces the activity of your body's immune system) at any time before starting TYSABRI treatment.

Your doctor should discuss the PML risk diagram (Figure 1) with you before you start treatment with TYSABRI.

Your doctor may test your blood to check if you have antibodies to the JC virus before you start treatment with TYSABRI. If you do not have antibodies to the JC virus, your doctor should repeat the test regularly to check if anything has changed. The risk of PML is higher in patients who have antibodies to the JC virus compared to patients who do not have antibodies to the JC virus.

**If you have all three risks described above your chance of getting PML is approximately 11 in 1000 patients treated. You should discuss with your doctor if TYSABRI is the most suitable treatment for you before you start taking TYSABRI and when you have been taking TYSABRI for more than two years.**

In patients with PML, a reaction known as IRIS (Immune Reconstitution Inflammatory Syndrome) is likely to occur after treatment for PML, as TYSABRI is removed from your body. IRIS may lead to your condition getting worse, including worsening of brain function.

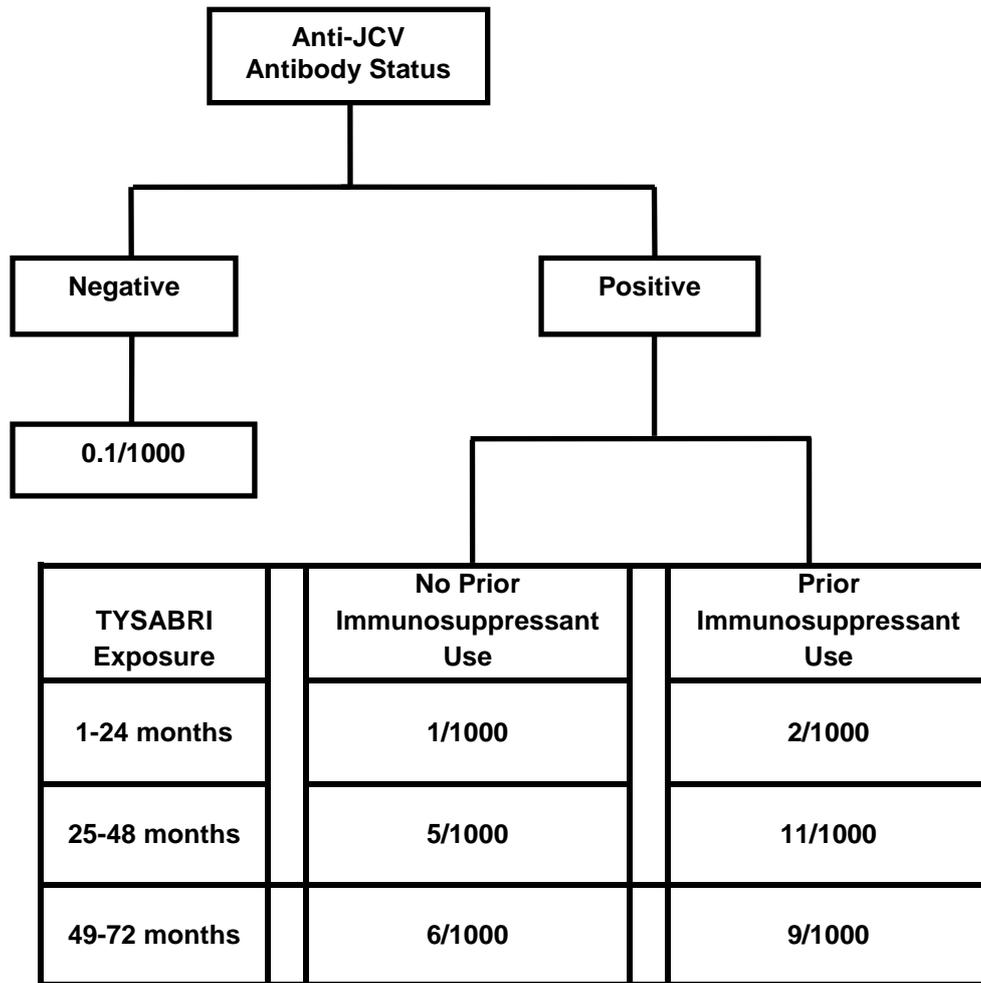

The Package Leaflet should be read each time that you take TYSABRI because it may have new information that is important to your treatment.

You should keep the Alert Card with you to remind you of the important safety information, in particular any symptoms you may develop which could possibly indicate PML, if appropriate, you should show the Alert Card to your partner or caregiver.

If you do not have the Package Leaflet or the Alert Card then please ask your doctor to provide them to you before you receive your infusion of TYSABRI.

**TYSABRI Treatment Continuation Form**  
**TYSABRI (Natalizumab) 300 mg concentrate solution for infusion**

**This form should be read carefully before continuing TYSABRI treatment for more than 2 years. Although you have been receiving TYSABRI for 2 years, it is important that you are reminded that the risk of PML increases beyond this time. Please follow the advice in this form to ensure that you are fully informed of, and understand the risk of PML (progressive multifocal leukoencephalopathy), IRIS (Immune reconstitution Inflammatory Disease) and other important adverse effects of TYSABRI.**

**Before continuing treatment with TYSABRI you should:**

- **read the Package Leaflet which is included in each box of TYSABRI;**
- **read the Alert Card given to you by your doctor;**
- **discuss with your doctor the benefits and the risks associated this treatment.**
